

Subject: Serosorting...The Future of HIV Prevention and Harm Reduction.

Date: Fri, 2 May 2008 06:23:38 -0400

When you and your co-workers woke up this morning, you went along with your daily routine, and came in to work. IF you were asked this question: How many forms of HIV prevention are there? YOU would have said : Only two, abstinence and safe sex. This morning, your answer was correct. However, NOW there are THREE ways to stop the spread of HIV.

SEROSORTING breaks the cycle of new HIV transmissions, and makes safe sex safer.

Upton Sinclair said it best: "IT IS DIFFICULT TO GET A MAN TO UNDERSTAND SOMETHING WHEN HIS SALARY DEPENDS UPON HIS NOT UNDERSTANDING IT."

Here in America and regardless of who wins the primaries or caucuses - man or woman, be they Democrat or Republican... Regardless if you are HIV+ or HIV-, man or woman, young or old and regardless of your race, income level, occupation or social status... The United States will be required to address the SEROSORTING issue.

The inconvenient truth about SEROSORTING is that it BREAKS THE CYCLE of new HIV transmissions, and makes safe sex safer. No one can argue against that fact.

How serious are YOU about stopping HIV / AIDS? IF we want to stop the spread of HIV, we must break the cycle of transmissions. 30 years of data and other supporting evidence have proven to us that the current HIV prevention and harm reduction strategies have failed. Therefore, we should strongly consider breaking the cycle of new transmissions.

*** What is SEROSORTING?**

Serosorting is having sex with your own HIV status. Examples are: HIV+ people having sex with other HIV+ people, and HIV- people having sex with other HIV- people. Therefore, it is a physical impossibility to transmit new HIV when people Serosort because SEROSORTING BREAKS THE CYCLE OF NEW HIV TRANSMISSIONS.

*** Who can SEROSORT?**

Anyone can have sex, but only those who KNOW their HIV status and are SERIOUS about stopping the spread of HIV can Serosort. So, only HIV+ and HIV- people can serosort. This has led to the substantial increase in HIV testing

and status disclosure across the nation in recent years.

*** How can a person SEROSORT?**

A person can serosort by doing the following:

- 1) Get an HIV test and knowing their HIV status.
- 2) Understanding and accepting the responsibility of being HIV+ or HIV-.
- 3) Disclosing their HIV status to others PRIOR to having sex.
- 4) Having sex with those of the same HIV status.

*** Why should anyone SEROSORT?**

This is an easy question to answer: To finally stop the spread of NEW HIV transmissions once and for all. To end HIV / AIDS.

*** What are the limitations to SEROSORTING?**

There are NO limitations of serosorting. ANYONE can serosort regardless of: race, age, gender, sexual orientation, income level, political or religious affiliations, geographical region or language. SEROSORTING DOES NOT DISCRIMINATE. Therefore, serosorting has become the most common method to prevent the spread of new HIV transmission in recent years.

*** What are the 3 ways to SEROSORT?**

The three ways to serosort are:

- 1) When HIV- people have safe sex with other HIV- people, NO HIV- person gets infected with HIV.
- 2) When HIV+ people have safe sex with other HIV+ people, NO HIV- person gets infected with HIV. And ...
- 3) When HIV+ people have bareback sex (sex without condoms) with other HIV+ people, NO HIV- person gets infected with HIV.

Therefore, Serosorting is another form of HIV Prevention and Harm Reduction, and only for those who are serious about stopping the spread of HIV. When people serosort, it is a physical impossibility to transmit NEW HIV to HIV- people.

This HIV prevention and harm reduction strategy is very successful when applied to minorities in major American cities and third world nations who can not afford very expensive health care, HIV related medications and LONG TERM HIV care. The billions of Dollars / Euros SAVED could be applied to FOOD, HOUSING, NEW JOB OPPORTUNITIES, and overall SOCIAL EMPOWERMENT.

*** What does SEROSORTING PROMOTE?**

This is truly the MOST EXCITING period in HIV prevention!

Serosorting promotes many things that the HIV "experts" and "professionals" have not yet realized, and it will be up to the researchers to document them.

- 1) Regular HIV testing for HIV- people,

- 2) Encourages those who are not tested, to get tested,
- 3) Communication between potential sex partners about HIV and other STD's,
- 4) HIV / STD and sexual health awareness,
- 5) Lowers the stigma of HIV, HIV testing and sexual health issues,
- 6) Safe sex,
- 7) Harm Reduction,
- 8) Psychological EMPOWERMENT
- 9) Economic GROWTH.

Thus, to PROMOTE Serosorting as another option of HIV Prevention and Harm Reduction, INCREASES public awareness, sexual safety, HIV / STD prevention and COMMUNICATION between potential sex partners (gay, bisexual, straight). To promote Serosorting is to promote a new communication strategy for the 21st. Century.

Serosorting PROMOTED in Seattle:

<http://brandonspozmsmsocialboard.yuku.com/topic/544>

GOOGLE search: Key word - SEROSORTING:

<http://www.google.com/search?hl=en&q=serosorting>

Therefore, mankind would need to decide, once and for all - Do we REALLY want to stop the spread of HIV? Yes or No?

Thank you for your attention to this. You and your co-workers now know of THREE HIV prevention strategies. I am at your service should you have any questions or need more information about Serosorting and how it breaks the cycle of new HIV transmissions.

The sooner we stop NEW HIV transmissions, the sooner we can move forward in helping each other globally. Rising transportation fuel costs for transporting food and medical supplies are hurting EVERYONE.

Respectfully;

Robert Brandon Sandor
